2. Intelligent Hospital Management & Patient Assistance Using Agentic AI

ABSTRACT

This project proposes a multi-agent hospital assistance platform designed to improve patient and hospital service coordination. Patient, doctor, appointment, medical-report, and pharmacy agents work together to handle common healthcare workflows. The system can assist with appointment requests, patient information, report understanding, and medication-related guidance. A RAG layer can retrieve information from hospital-approved documents, policies, and service databases. Agent collaboration enables requests to be routed between departments while maintaining a clear interaction history. The platform aims to reduce waiting time, improve information access, and support efficient hospital operations, while keeping human professionals in control of clinical decisions.

MAIN AGENTS / FEATURES: Patient, Doctor, Appointment, Report, Pharmacy Agents
